To the hiring leader building a Data & AI organization

Reliable data and AI capabilities depend on clear platform direction, sound engineering and teams that own delivery. I bring 23 years of professional experience, including 22 years in software engineering, spanning distributed systems, data infrastructure and global engineering leadership.

As Director and Architect, Data & ML Platform at Coursera + Udemy, I own the Data, ML and AI platform on AWS and Databricks and lead the Coursera–Udemy platform integration. I translate business needs into platform priorities and work with Legal, Compliance and business teams on privacy, enterprise data commitments and responsible AI adoption. My approach connects architecture, reliability and governance with accountable delivery.

At Experian, I built and led a 75-person engineering organization across the US, Latin America and India, through four engineering managers, one director and one architect. We delivered a next-generation analytics platform at multi-petabyte scale for a regulated data business. At LendingClub, I progressed from Principal Software Engineer / Manager to Director, designed and built real-time data pipelines supporting credit risk and regulatory reporting, and led cloud modernization. Earlier work at VMware, Teradata and Yahoo grounds my decisions in distributed analytics, virtualization and Hadoop engineering.

I stay close to architecture and early prototypes while developing leaders who can make good decisions independently. That means sharing business context, setting clear outcomes, welcoming technical challenge and giving teams room to own the solution. I also build AgentBreeder.io and 100xPrism independently, outside my employment, to stay hands-on with AI engineering and test ideas about deployment, governance and development workflows.

I welcome conversations about senior engineering leadership where data engineering, ML platforms and enterprise AI are central to the business. I would be glad to discuss your platform priorities and how I could help build the organization to deliver them.

Sincerely,

Rajit Saha
